

FRAC LIST OF PLANT PATHOGENIC ORGANISMS RESISTANT TO DISEASE CONTROL AGENTS

Revised January 2011

The scope of the list.

The FRAC codes used in this document refer to those used in the FRAC Code List. The entries are listed by their Mode of Action code, with the Chemical Group Codes and Group Names also being given for reference. *For more information please refer to the latest edition of the FRAC Code list.*

This list is extensive in identifying those plant pathogens that have shown some form of resistance to the modes of action given and to the respective chemical groups.

Entries have generally been selected as the first confirmed, published, case of resistance of the particular mode of action against the pathogen listed. Subsequent references for the same mode of action and host-pathogen combination are only included if the information is considered by FRAC to be of special merit e.g. information on the molecular mode of resistance. Inclusion of cases of a known pathogen but a new host e.g. *Botrytis cinerea* are considered on their merits. Similarly, references reporting a known case but in a different geographical region are also considered on merit and may not be included.

Take care in using this list.

Care must be taken in using the information because:

- 1.** Inclusion of a pathogen in this list only demonstrates that it can become resistant. It does not indicate that pathogen populations in specific geographical areas or locations are resistant. Seek local advice for specific localities. Information may also be found at the FRAC web page for specific chemical Working Groups. See www.frac.info
- 2.** Resistance in plant pathogens can take many forms and it is important to realise the differences when consulting this list. The 'Remarks' column gives guidance on the form of resistance found and can be interpreted as:

Laboratory mutation / selection: Indicates that the resistance has been selected for using various techniques including mutation by UV light, or chemical mutagenesis. Such research illustrates that resistance can happen and can provide information on the resistance mechanism, but is not a reliable indicator of the probability that resistance will happen when the chemical is used in the field.

Field trial: Indicates that resistance has been found in limited field trials. Very often such trials use application schedules that are different to commercial practice and/or are designed to pressurise pathogen populations into becoming resistant in an attempt to quantify the resistance risk. Such trials show that resistance can be generated but do not give reliable indications that resistance will occur if products are used as recommended.

Field: Indicates that resistant isolates have been found in commercially treated fields. This does not mean that the resistance was always extensive enough to cause complete disease control failure, but does indicate a need for active resistance management.

- 3.** For pathogens capable of infecting several host genera / species e.g. *Botrytis cinerea*, the list does not include reference to all known crops. For such pathogens it is reasonable to assume that if resistance is known, all areas of use are at risk and resistance management strategies should be used.

INDEX OF FRAC CODES
For more detail on these codes see the FRAC Code List

Cross – resistance between chemicals in a particular group.

Resistance and cross-resistance between molecules in a particular group is not always absolute due to different activity spectra shown by group members. Be careful when making assumptions about cross-resistance patterns and if in any doubt refer to FRAC or the manufacturer.

A note on taxonomy

This list has been compiled using the taxonomy in use at the time the report was made. In some cases organisms have been reclassified since the original report and names have changed. Where names have changed recently, users of this list are advised to search using the old name as well as the new one.

Further guidance

Please see information published by FRAC and contained in the FRAC Monographs, available for download from the FRAC webpage www.frac.info

Updates

FRAC welcomes suggestions for inclusion in this list; please send information, including full Journal reference, to the Secretary. Note that only cases of confirmed resistance will be included, supported by a published report from an accredited source. Reports of rumours of resistance or unverified reports will not be included. The decision on inclusion rests with FRAC.

A note on mercury:

Mercury was a traditional seed treatment for cereals. It is no longer used and, as such, does not appear in the FRAC list of fungicides. Resistance did develop to it in *Pyrenophora avenae* on oats, Noble *et al.* (1966), and for *Pyrenophora graminea* on barley, Clark (1985).

Mode of Action Code and Target Site	Group Name	FRAC Group Code
A: NUCLEIC ACID SYNTHESIS		
A1: RNA polymerase I	PA Fungicides Phenylamides	4
A2: Adenosine deaminase	Hydroxy – (2-amino) pyrimidines	8
A3: DNA/RNA synthesis (proposed)	Heteroaromatics	32
A4: DNA topoisomerase type II (gyrase)	Carboxylic acids	31
B: MITOSIS AND CELL DIVISION		
B1: β -tubulin assembly in mitosis	MBC fungicides, Methyl Benzimidazole Carbamates	1
B2: β -tubulin assembly in mitosis	N-phenylcarbamates	10
B3: β -tubulin assembly in mitosis	Benzamides	22
B4: Cell division (proposed)	Phenylureas	20
B5: Delocalisation of spectrin like proteins	Benzamides	43
C: RESPIRATION		
C1: Complex I, NADH oxidoreductase	Pyrimidinamines	39
C2: Complex II, succinate-dehydrogenase	SDHI fungicides	7
C3: Complex III, cytochrome bc1 (ubiquinol oxidase at Qo site (cyt b gene))	QoI fungicides, Quinone Outside Inhibitors	11
C4: Complex III, cytochrome bc1 (ubiquinone reductase) at Qi site	QiI fungicides (Quinone Inside Inhibitors)	21
C5: Uncouplers of oxidative phosphorylation	-	29
C6: Inhibitors of oxidative phosphorylation. ATP synthase	Organo tin compounds	30
C7: ATP production (proposed)	Thiophene carboxamides	38

Mode of Action Code and Target Site	Group Name	FRAC Group Code
D: AMINO ACIDS AND PROTEIN SYNTHESIS		
D1: Methionine biosynthesis (proposed) (<i>cgs gene</i>)	AP fungicides. Anilinopyrimidines	9
D2: Protein synthesis	Enopyranuronic acid antibiotic	23
D3: Protein synthesis	Hexapyranosyl antibiotic	24
D4: Protein synthesis	Glucopyranosyl antibiotic	25
D5: Protein synthesis	Tetracycline antibiotic	41
E: SIGNAL TRANSDUCTION		
E1: Signal transduction (mechanism unknown)	Aza-naphthalenes	13
E2: MAP/Histidine-kinase in osmotic signal transduction (<i>os-2, HOG1</i>)	PP fungicides. Phenylpyrroles	12
E3: MAP/Histidine-kinase in osmotic signal transduction (<i>os-1, Daf1</i>)	Dicarboximides	2
F: LIPIDS AND MEMBRANE SYNTHESIS		
F1	Formerly dicarboximides	
F2: Phospholipid biosynthesis, methyl transferase	Phosphoro thiolates and dithiolanes	6
F3: Lipid peroxidation (proposed)	AH fungicides (Aromatic Hydrocarbons)(chlorophenyls, nitroanilines and heteroaromatics)	14
F4: Cell membrane permeability, fatty acids (proposed)	Carbamates	28
F5: Moved to H5	CAA fungicides. Carboxylic Acid Amides	40

G: STEROL BIOSYNTHESIS IN MEMBRANES		
G1: C14 demethylase in sterol biosynthesis (<i>erg11/cyp51</i>)	DMI fungicides. DeMethylation Inhibitors. SBI Class 1	3
G2: Δ^{14} reductase and $\Delta^8 - \Delta^7$ isomerase in sterol-biosynthesis (<i>erg24, erg2</i>)	Amines ('morpholines'). SBI class II	5
G3: 3-keto reductase, C4-demethylation (<i>erg27</i>)	Hydroxyanilides. SBI class III	17
G4: Squalene epoxidase in sterol biosynthesis (<i>erg1</i>)	SBI class IV	18
H: CELL WALL BIOSYNTHESIS		
H3: Trehalase and inositol biosynthesis	Glucopyranosyl antibiotic	26
H4: Chitin synthase	Polyoxins	19
H5: Cellulose synthase	CAA fungicides. Carboxylic Acid Amides	40
I: MELANIN SYNTHESIS IN CELL WALL		
I1: Reductase in melanin biosynthesis	MBI-R Melanin Biosynthesis Inhibitors - Reductase	16.1
I2: Dehydratase in melanin biosynthesis	MBI-D Melanin Biosynthesis Inhibitors - Dehydratase	16.2
P: HOST PLANT DEFENCE INDUCTION		
P1: Salicylic acid pathway	Benzo-thiadiazole BTH	P
P2: Benzisothiazole	Benzisothiazole	P
P3: Thiadiazole-carboxamide	Thiadiazole-carboxamide	P
P4 (proposed):	Natural compound	P

G: STEROL BIOSYNTHESIS IN MEMBRANES						
G1	3	DMI Fungicides (DeMethylation Inhibitors) SBI Class I. C14-demethylase in sterol biosynthesis (<i>erg11 / cyp 51</i>)				
		IMPORTANT NOTE: The DMI group includes several areas of chemistry (See FRAC Code List) and many molecules. Individual molecules can differ widely in their activity spectrum. Cases are known where resistance to one molecule does not always lead to resistance to another molecule. Reasons for this phenomenon are not always clear but appear to be linked to differences in the intrinsic levels of activity between molecules. If in any doubt assume that cross resistance can happen.
